

Drawbar fuel trailers

Quality that pays off

With HMK Bilcon's **drawbar fuel trailers**, you get our thoroughly tested robust concept trailers manufactured according to our high-quality standards. The front part of the trailer chassis is made of hot-dip galvanized steel, while the remaining part is produced in aluminum. These trailers are fitted with three SAF axles.

In the development of our drawbar fuel trailers, we have placed great emphasis on volume, stability, user-friendliness, and maneuverability to meet the stringent requirements for transporting ADR products. The fuel trailers are weight-optimized with a low unladen weight of around 5,100 kg and an allowed total weight of 27 tons.

Option for additional equipment

The drawbar fuel trailers come equipped with all mandatory signs, lights, and cyclist protection, but there is an option to purchase additional features such as LED work lights in the dome frame, extra LED taillights and side work lights, tubes in the API cabinet for storing 2 drop hoses, a storage box in the API cabinet, and a reversing camera.

With HMK Bilcon's drawbar fuel trailers, you don't just get transportation for oil and petrol but also a reliable and efficient solution that meets the highest standards in terms of safety, user-friendliness, and durability.

BENEFITS
