

# Hook lift fuel tank system

For many years HMK Bilcon have supplied fuel tanks in aluminum intended for hook lift systems for both civilian and military purposes. The fuel tanks can be used for many different tasks, including ensuring the delivery security of civil emergency services to critical infrastructure for e.g. schools, nursing homes, municipalities and hospitals and institutions critical to society.

With a fuel tank that can be moved from place to place, you have a fully functional standby tank solution that always works when you only need to supply fuel occasionally. The tank can be moved with a hook lift, which is usually used for other tasks. It is quick to switch to fuel driving if an urgent need arises. It can also be used e.g. during busy periods in e.g. the agricultural sector etc.

The tank holds 17,000 liters and can be specified with 1 or 2 compartments and equipment as requested, including whether the delivery system comes with MID approved measuring system or not. The fuel tank is delivered with the desired length of pump hose on a hose reel with a delivery nozzle. The tank comes with a hydraulically driven delivery pump with quick couplings for the truck's hydraulic equipment. It is mounted on an ISO container chassis and can be used for hook lifts. The truck with hook lift must be ADR approved to be able to drive with the fuel tank, just as the driver must have an ADR permission.

## Benefits of HMK Bilcon's hook lift fuel tank system

- Optimized solution
- Easy to load on truck with hook lift
- User-friendly solution
- High quality and a long product life
- High resale value
