

City Trailer

For many years HMK Bilcon has produced city trailers for transport and supply of oil and gasoline. We have now developed a new generation of the city trailer so that it is further optimized for urban driving in the Scandinavian market.

New improved generation

The tank of the new generation is made a bit longer with the same reachability, so it is now possible to transport 37,000 liters. The City Trailer is built with two forcibly driven axles with the VSE control system, which makes it easy for the driver to steer the trailer around even under tight urban access conditions. The connection between the signal transmitter and the control box is now electronic instead of previously hydraulic, and in addition the trailer can be operated from the cab.

The tank is basically divided into 7 compartments, but a smaller number of compartments can also be offered if necessary. It comes with pump delivery equipment with MID approved metering system and two hose reels at the rear.

Increased user-friendliness with SafeCon

We have developed our own control system SafeCon to insure that operating the tank truck is as easy as possible. The system makes the operation of the truck very simple and reduces the risk of operating

Benefits of HMK Bilcon's city trailer:

- Larger amount of product on the truck in one transport
- Better accessibility and maintenance with VSE control
- Individually optimized solutions
- High quality and a long product life
- High resale value
- User-friendly
